Kepler - Bug #4195

Report Designer - 'Location aware' rendering of newly dropped panels.

Target version:	2.X.Y	**Spent time:**	0.00 hour
Bugzilla-Id:	4195		

Description

Right now, when a user drops a report item onto a report, the report designer simply places the panel at the end (bottom) of the group of report items. If the user wants it somewhere else they then need to perform a second drag and drop to position it where they would like it to appear. It would be better if they could drag it to the approximate position where they would like to insert it, and have it show up at that position (when the layout is rendered) instead. Not sure if this is correctly targeted for the upcoming SanParks release, but will work on it as soon as any remaining higher priority items are complete.

#2 - 07/07/2009 03:07 PM - debi staggs

Moving this enhancement to the next release, since it will touch some of the core functionality of the report designer, and will require more time to complete and test.

#3 - 07/27/2009 11:25 AM - debi staggs

When the user drops a report item onto the report, the item now places it where they have dropped it, and it no longer just puts it at the bottom. :)
