Description

Reported by Edward Lee:

The Kepler icons seem to be sized so that Vergil's snap-to-grid doesn't really work. If I connect an output port to a relation to an input port, I can't get the connections to give me straight lines. This is rather unfortunate, as it makes all Kepler diagrams look a bit sloppy. This can be fixed by resizing the Kepler icons to match the default size in the basic Vergil editor for Ptolemy II.
