Kepler - Bug #4046

ComadTest should report more details when detecting an error

05/01/2009 01:05 PM - Timothy McPhillips

Description

The ComadTest actor is used to create automated tests of COMAD features. Because it is often useful to include several instances of ComadTest in the same test workflow, the ComadTest actor should report its name when it throws an exception. Ideally it also would indicate something about how the data stream it received during the current workflow run does not match what it received during training--perhaps the element name and line number of the first mismatch in the trace?
