Target version:	3.0.0	Spent time:	0.00 hour
Bugzilla-Id:	1073		
Description			
<p>Allow users to edit party records that they are the owner of, i.e. they (the user) are the same as the party (link via user database that identifies which party.party_ID they are) that owns this record (party.owner).</p> <p>all changes should be added to the revisions table.</p> <p>Furthermore, split from bug 852: ------(bug 852, comment 4)----- from Bob:</p> <ol style="list-style-type: none">1. There is the problem that there are party attributes that a user needs to be able to update and which are not on the profile page that the user edits. This should be added. <p>That is, the party table has attributes not on the "edit profile" form. We need to either add these fields to that form, or we need to make a new form for people to edit any party that they are the owner of.</p> <p>------(bug 852, comment 6)----- We need some business rules here. Ownership is by a registered user. We currently track registered users as unique by email address. We do not require email for a party (we do not always know an email). How do we link registered users with parties? And, how do we affect the transfer of ownership from a second-party creator to a registered user who wants to take over his own party?</p> <p>I suggest:</p> <ol style="list-style-type: none">1. We move to primary key as the unique identifier for a registered user so that email is no longer the unique identifier. Upon logging in the registered user should be able to edit his/her email address, just like other user attributes. <p>[MTL - I like the idea of allowing users to change their email, provided the email address they specify is not already on the system. Email would still be the logon]</p> <ol style="list-style-type: none">2. A new user when registering will create a new party by default. That user can then send an email to the system manager requesting that one or more extant parties be synonymized with the new party just created. This would require that the manager reset part[y]:currentName_ID to point at the user's party record. This also suggests a new function needed in the management interface.3. We remove or minimize the redundancy between the user registration table and the party table. We don't want name, organization, address, etc stored in both places.

users can edit their own party, currently, but not parties they have added. Nor can they submit revisions or updates to plots and other data. Such functionality is desired, though may be difficult to put together in a way that they can use (some kind of batch of updated, likely).
