Description

I think we need to add a metacat-info action so that you can send a request to metacat and it will print selected properties from the properties file as well as the actual metacat version that is running. I think the version is actually the most important info that we need but other things that could be returned are the database name, the jdbc connection string, etc. this would be very useful for debugging.

History

FIXED. Added a "getversion" command to determine which version is running. This does not return other information from the property file because its not really a good idea to expose this information (e.g., the jdbc string is sensitive information). That stuff will need to be retrieved from the properties file by someone with access to it.
