Description

currently, the eml2 ingestion actor outputs a record token which may or may not be the format that we want to output to other actors. Need to research other data structures to encapsulate the data. This may involve writing a different director to use with tabular data.

History

One idea is to make the output ports be dynamic in that there would be one port per attribute in the data file. this would allow attribute level port selection.

#2 - 02/10/2004 08:59 AM - Chad Berkley

moved these bugs into the kepler bugzilla profile.
