Description

The emlb6 to eml2 conversion stylesheets that are used by webmdentry are presently in a temp directory. This is the directory where all the emlb6 files are downloaded and converted. But the stylesheets should go in a permanent directory. They are presently in the temp directory because they are not able to convert emlb6 files if the emlb6 files are downloaded to any other directory other than the directory in which the stylesheets are stored. This is the bug which needs to fixed so that the stylesheets should be able to transform the emlb6 files irrespective of where they are downloaded.
