Description

Instead of using the back button, there could be a button on the error page
which does the same work as 'No, I want to edit the document' on the confirm
page. I am assigning P1 to this as it would prevent a lot of effort for people
using browsers which donot store value. Also it is useful in cases like dynamic
taxon fields.

Andrea's comments:

This was already mentioned to you at one of the meetings this week, but in case
you didn't record it: After entering information into the form at the NCEAS
Data Repository web page, and clicking "Submit Entry", I was informed that I
missed some required information and should go back. I went back (using my
browser's Back button), and all the information I had already entered had
disappeared
