Description

Metacat client package comminute metacat through sessionid for keeping track the user. Those sessionid wasn't stored in login function. So sometimes it will cause error. For example, when you login in web site, then search metacat. The sessionid of login wasn't stored and user is still public when you do search action.

History

#1 - 03/15/2004 02:33 PM - Jing Tao

In handle login method in MetacatServlet class, the sessionid and session which stored user name and password will be put into a hash table if user successfully login. This is only place we store session. Whant a quest come to metacat, then we will check in there is a sessionid parameter, if it does. We will pull out the session for the request.

The testing works fine after the code change.
