Description

Current access list dialog allows users to select only one person in the user tree at a time, and set permissions for that user. This enhancement request is to allow for multiple user's ACL entires to be changed and selected at once. To accomplish this, one possible approach would be to: 1) allow multiple select from the table of access rules, and 2) select each of these in the tree when moving to the access tree. Adding more users by shift clicking would add new records to the table. Need to be careful that it is clear to users that if they deselect a person from the tree, their entry will be removed from the table. As users can be spread apart very far in the tree (so multiple selections aren;t simultaneously visible), this might be hard, especially because a single click on the tree clears all of the current selections. We might want to change the selection mechanism for the tree to be a 'double click' on a user to toggle selection/deselection. This would make it harder to accidentally clear a bunch of records, even though it is somewhat non-standard (shift and ctrl click are more typical).
