Description <p>I am importing a data table consisting of several columns of image data into an existing data package using the New Datatable Wizard. I am defining the attributes (columns) of the table,using the Add button. I have selected the Absolute category for the column, and have completed the 'Define new unit' process to create a new unit type called 'Radiance' (this data is remote sensing data). OK, so for the first column this was successful.</p> <p>Now, I need to describe the second column (also radiance) in the data table. I complete the top half of Define Attribte or Column screen, selecting the Absolute category again, then select a unit type for this column. I would like to use the 'new' unit type that I created for the previous column, but it is NOT among the list of Standard Unit types, and I have to repeat the Define new unit process again.</p> <p>Note: ONE of the new unit types I created for another test IS in the unit type dropdown, so I know that it is possible to add persistant new unit types. It just does not happen every time I try to add one.</p>

fixed by Peru (changed so that custom units are now available for reuse within a package).
