Description

I think we need a revised user interface for inserting, updating, and deleting metacat documents from within dmanclient. Insert and update should have very natural interfaces that are only minor extensions of the 'Save as...' and 'Save' menu items, respectively. The current 'ID' assignment (from the SaveToDatabase dialog) should be another field that parallels the filename field in the Save As dialog. The 'ID Label' field in the SaveToDatabase dialog should become a user-configurable preference, rather than something that is set for every document individually. The 'Save As...' dialog should have a radio button to choose whether to save locally or to the database (which enables/disables the appropriate text entry fields).

This would mean eliminating the current 'Save to Database...' menu item and dialog box. The 'delete' function from that dialog should become a menu choice that is accessible from the querybean popup menu (right click on document in resultset display, choose 'Delete', get confirmation dialog). The 'File to Submit' part of the dialog should be eliminated entirely (users should open a document to make a change). The 'Access Control' part of that dialog should become a separate dialog that the user can open from the 'Save as...' dialog box and by selecting a menu item from the querybean resultset context popup menu.
