

Morpho - Bug #1555

Unable to open data files of local data packages that are created in another profile

05/05/2004 03:34 PM - Perumal Sambasivam

Status:	Resolved	Start date:	05/05/2004

Bugzilla-Id:	1555		

Description

If we create a local data package (with some data file) with public access in one profile, and try to open that package from another profile, Morpho is unable to retrieve that data file and hence displays a blank table.

Morpho looks for the data file in the data directory of the current profile, while the data file is actually in the directory of the created profile.

The real bug here is the fact that metadata from other profiles is visible, not that data files are not!

The idea was to pseparate the information of different users, at least logically even when it is stored locally. I think the bug occurs because currently open packages are not closed when the profile is changed. The metadata stays in local caches while Morpho is running. These caches should be flushed when the profile is changed (i.e. information is not meant to be shared between profiles except through the access-controlled network.

I cannot open a datapackage from a different profile than my current profile. Closing.
