Bugzilla-Id:	1562		
Description			
When opening a data package that was created with eml beta6, and using Java 1.4, the "local" icon on the data package display is missing. This specifically occurred with the fictitious data package by "jscientist".			

History

#1 - 05/14/2004 04:31 AM - Dan Higgins

This 'bug' is really a deliberate 'feature' (although one that is apparently not understood ;-). When a beta6 eml doc is opened and automatically transformed into an eml2 document, that new transformed document has never been saved. It was thus thought that it was appropriatw to display this as a 'new' document which does not exist either locally or on the network. Thus, no icon is displayed, which is exactly the same treatment as a newly created document. This was meant to indicate the the transformed eml2 document needs to be saved to make its transformation permanent.
