Bugzilla-Id:	1586		

Description

This task is for query data object locally (in Kepler). After loading data object into db system (See bug 1584), we need a engine to excute the query which user specifies in UI. This engine will connect db, excute the query and return the data object.

History

We use hsql as sql engine in kepler and use can set a text file as data source. It works fine. The implemenation is in dataquery package.
