Bugzilla-Id:	1671		

Description

When a registry entry has keywords and the entry is edited through the web site, the keywords are not propagated to the new form, and therefore are lost in the process of editing. This was probably introduced when keyword fields in the form were changed to be dynamically generated using javascript (rather than being a fixed number as before).

Fixed.

The bug came into picture, when no keyword type is suggested for a particular keyword. This resulted in ignoring of that row of data.
