Description

Currently the "Get metadata" function only works for EML 2.0.0. The version is hardcoded in the code, but instead it should be determined from the namespace of the EML document and then used to lookup the appropriate XSLT stylesheet to be used. This is a fairly straightforward change, but EML200DataSource needs to be extended to provide access to the namespace information.

History

#1 - 03/01/2005 03:01 PM - Jing Tao

In ResultRecord class(parent class of EML200DataSource), a field - namespace was added. After searching, the namespace will be set there. So in EML200DataSource, the hard code of namespace was removed. Instead, the namespace will be gotten from the get method.
