Target version:	Unspecified	Spent time:	0.00 hour
Bugzilla-Id:	1822		
Description			
After getting a dp from the network, editing it and saving it locally, you can successfully save it back to the network (although the name in the docid is changed). Access permissions should prevent this from happening.

Can you clarify if the new document is using the same docid? My guess is that it is not, and so what has happened is that you have made a **copy** of the package and uploaded the copy to the system. There is nothing we can or should do about this in terms of access control, as sometimes this is a perfectly desirable and appropriate action. However, we probably can make UI improvements to clarify what is happening and why so that the user can make appropriate choices and not accidentally make copies of documents.

If this is in fact the same docid and access rules prevented write access, then it is indeed a bug we need to fix. Thanks for the clarifications.

#2 - 12/15/2004 04:42 PM - Andrea Andrea

The new doc has a new docid, and therefore this isn't a bug
