Target version:	1.8.0	Spent time:	0.00 hour
Bugzilla-Id:	1847		
Description			
<p>We need to implement a feature that allows the import of EML documents and tabular data associated with these documents. The import step would include validation to ensure that the document is a valid EML document. The docid of the imported document would be compared to the docids of local data packages. If a similar docid is found, Morpho would ask whether the user wants to create a revision of the existing dp or create a new dp. If no similar docid is found, Morpho would automatically create a new dp (with a new docid).</p> <p>This import feature would allow importing documents that have been created by the current Export feature of Morpho. Currently, there is not a straightforward way of opening in Morpho a data package created by the Export command (see bug 1793). When using the Export command, the document created should be saved in a place where it will easily be retrieved when using the import feature.</p> <p>On top of allowing the import of existing EML documents, the import feature would allow users to have a "template" dp from which they would create new dps that usually differ only slightly in their format. This would lessen the burden of creating new dps from scratch.</p>

Laura Downey's Morpho Usability Report (resulting from Feb. 2005 KNB workshop) mentions this feature as a "future feature to strongly consider."

#3 - 06/17/2005 03:49 PM - Saurabh Garg

Added a new feature which makes a copy of the opened data package. Hence a data package can be made and then used as a template to create similar datapackages.

This is not same as the import feature but would be useful for the users requesting template like functionality.

#5 - 11/12/2009 12:09 PM - Jing Tao

During the import, if data file location is a remote one, we will do nothing. If it is in local file system, we should import it into morpho.

#6 - 01/25/2010 10:46 AM - Jing Tao

Add a new menu - "import" into morpho. User can use it to import an eml document into morpho. For data file, the behavior will be as same as the

above comment.
