<b>Description</b> Currently EML data source actor only handle one data entity. But eml2 metadata can specify mutiple data entity (e.g. data table) in single document. We need add new feature - handle mutiple data enity in eml data source actor to match eml2's feature.

Add Vector \_enityList in EMLDataSource to store the mutiple entity in eml. And add a selectedEntity for chosed entity. If there is has sql command which involved mutiple tables, the selectedEntity wouldn't be used if the outtype is As Fields or As Row.
