<b>Description</b>			
Need to be able to add-remove & access the windows created from plugins from the menus in the top level container. Make the "Windows" menu functional for all plug-ins.			

### History

#### #1 - 04/25/2001 11:20 AM - Matt Jones

Feature completed with new framework architecture. The CClientFramework class now has a public API for registering (addWindow()) and removing (removeWindow()) windows. When a plugin calls addWindow, the "Window" menu is updated with a new item to bring that window forward. When removeWindow is called, the menu item is deleted. The menu item name is gotten from the Window name, so plugins should be sure to call "setName()" on their window before registering it with the framework "addWindow()" method.
