

Utilities - Bug #2072

XMLUtilities.print() prints whole document rather than the passed base node

04/29/2005 09:33 AM - Chris Jones

Description The print() method in XMLUtilities is supposed to print starting at the base of the node that is passed in. Instead, it calls node.getOwnerDocument() and ends up printing the from the document root as the base. Perhaps the XMLSerializer should use the serializeNode() method and be passed the node rather than the whole document.
