Description

When you import taxonomic information as a data table, the information doesn't get saved in the data package:

I went to "Taxonomic coverage" under the documentation menu, clicked on the "Import Taxon Information from Data table" link, selected a column, chose "species" as the taxon category and clicked OK. The first row of the table under "Enter information about Taxonomic Coverage" had this information:

Rank: Genus; Name: blank (empty cell); Rank: Species; Name: blank (empty cell)

The following rows had the information I imported from the data table. When I clicked on OK and went back to the dp, the taxonomic information I had just imported didn't appear in the Data Package Documentation panel.

Having the first row of the "Enter information about Taxonomic Coverage" table empty seems to be causing this problem because if you manually enter info in this row using the Add button and then import info from a data table, all of the info gets saved and appears in the Data Package Documentation panel.
