Description need a module that can combine the results of multiple query screens into a single pathquery document for submission to the query execution engine. We agreed in March that this could be essentially a boolean AND (INTERSECT) among the different query types (text, taxonomic, spatial, etc), but it needs to be possible. The user interface for the query component might be a series of tabbed panes ina dialog, so the entity that creates the dialog might also be the one that combines the queries.

Done. Queries can now be composed using the API found in the Query class, and the QueryDialog class is able to combine queries from the multiple query composition tabs into a single unified pathquery, which can be serialized as XML and reloaded into the QueryDialog when needed (for revisions, etc). Will need to add the spatial query tab into this functionality when it is developed.
