Description

The Morpho Search feature does not search all of the data package when a local search is chosen. The Document ID or User ID are not included in the local search.

The network search will bring up data packages that have text that is contained only in the Document ID.

The fact that the local search does not search on the Document ID can be tested by searching the sample data package called jscientist.7.1. The text that is only in the Document ID will not bring this package up when searched for locally. Doing a search on 7.1 will not bring up this data package. Usually text in the document ID is repeated in other places in the document that the local search finds. But if the Document ID or User ID are not included in other areas of the data package such as in the title, abstract or keyword the data package will not come up when searched for locally.

If a document package is created with a user ID or Identifier prefix that is not repeated elsewhere in the document it will not come up on a local search. On the network search, this kind of search will bring up a data package.
