#### Description

From Bug# 1622:

----- Additional Comment [#6](#) From Matt Jones 2004-07-23 08:54 -----

And Sid, in fixing this I think what we should be doing is running the eml parser on the document when a Save event is detected. If the validation fails, we should at a minimum provide an understandable list of the places where more metadata is needed, but even better guide them to those locations so that they can fix them quickly and easily.
