

Metacat - Bug #2377

No Default Namespace in Records

03/02/2006 03:12 PM - David Sledge

Status:	Resolved	Start date:	03/02/2006

Description

Looking at this record in metacat in XML, I noticed that only the root element has a prefix ("eml:"), and that there isn't a default namespace URI declared for elements without prefixes. I've looked at a few other records, and so far they all follow the same pattern.

I tried to see if the records would validate against the eml*.xsd files despite not having prefixes, but then I ran into bug 2054

(http://bugzilla.ecoinformatics.org/show_bug.cgi?id=2054).

David, can you show an example where this is the case. If the EML doesnt have namespace specified then the namespace wasnt probably specified when the document was inserted.

#2 - 06/30/2006 08:55 AM - David Sledge

Sorry, I meant to close this out. I looked up the XSD specs and the "elementFormDefault" attribute, and I found a workaround for bug 2054 to get it to validate.
