

Kepler - Bug #2381

Problem with alpha9 MacOSX Installer build

03/10/2006 11:45 AM - Dan Higgins

Target version:	1.0.0rc1	Spent time:	0.00 hour
Bugzilla-Id:	2381		
Description			
<p>The InstallAnywhere build for KeplerAlpha9 does not work properly. If one double clicks the installed Kepler-alpha9 icon, it looks like the installed application starts up, but it then just terminates with no error messages!</p> <p>I have been unsuccessful in tracking down the source of this problem after several days of work. The Uninstaller works, so it is something specific to Kepler itself. The shell file added by InstallAnywhere works (i.e. one can launch alpha9 using the shell script 'kepler.sh' from the terminal on a Mac).</p> <p>Out version of InstallAnywhere is not the most recent. I doubt the advisability of updating, given the expense and uncertainty. We may want to consider another method for building installers, especially for the Mac.</p> <p>Dan Higgins - March 10, 2006</p>			

History

#1 - 06/08/2006 01:45 PM - Dan Higgins

problem fixed with the Beta1 installer; won't bother to go back and fix alpha9 version
