Description

Data source icons in the Data search-results list are currently rendered badly (the display is trying to render a small version of the vector icon defined in DataSourceIcon.java). Instead, need to do 2 things:

- 1) add code to make the system assign raster thumbnail icons to the list entries - see Bug [#2362](#). These "actors" currently do not get the new svg or raster icons assigned, because they are not instantiated via ActorMetadata.java, where the icon-assignment code is.
- 2) Change the list display code so it looks for and renders the raster icons instead of the default ptii one. Not sure where the code is to do this, since I haven't looked yet, but I'm guessing it might require digging deep...
