Bugzilla-Id:	2577		
Description			
Some applications may want to do direct queries on the data tables in the database. The application will need to map entity names to table names, and attribute names to field names. Extend the Data Manager Library API to provide a method to enumerate the table and field names for a given entity.			

History

#1 - 12/15/2006 08:53 AM - Duane Costa

This is now supported with the following four methods in the DataManager class:

```
public static String getDBFieldName(Entity entity, Attribute attribute)
public static String[] getDBFieldNames(String packageID, String entityName)
public static String getDBTableName(String packageID, String entityName)
public static String getDBTableName(Entity entity)
```
