Description			
RKP: A different but related issue is whether a CVS only map of <i>Acer rubrum</i> var. <i>rubrum</i> should show <i>Acer rubrum</i> with NO var. as an ambiguous occurrence. I think it should. This should be corrected.

The reason *Acer rubrum* is not included for CVS as ambiguous occurrence for *Acer rubrum* var. *rubrum* is that CVS follows "Alan Weakley". There is no conceptual ambiguity between *Acer rubrum* sec. Alan Weakley and *Acer rubrum* var. *rubrum* sec. Alan Weasley. Of course, *Acer rubrum* sec. Alan Weasley could be *Acer rubrum* var. *rubrum* sec. Alan Weasley since the later is part of the former. But this is hierarchical ambiguity within the same classification system, which is different from the conceptual ambiguity between concepts of different classification systems. Currently, for a source that follows Alan Weakley, only the name-matched concepts are retrieved. No children and no parent are retrieved. We can make following changes:

1. If a data source follows Alan Weakley, e.g. CVS, besides the name-matched concept, all children concepts will be retrieved as unambiguous occurrences, and its parent concept will be retrieved as ambiguous occurrences.
2. If a data source does not follow Alan Weakley, only related concepts are retrieved.

Please check this and let me know if it is OK so that I can move it into implementation.

Yes, please implement.

#4 - 12/03/2006 11:56 AM - xianhua liu

fixed. check <http://152.2.14.231/website/NCFloraTest> before herbarium server gets updated.
