Description

Tom Wieboldt writes:

"Well now, that is pretty spiffy! But I thought I should probably tell you that it didn't quite work for me as it's supposed to. When I fill in scientific name and state and hit GET TAXA (shouldn't this be "taxon", or can you retrieve more than one?), a new screen appears with the message "No state specified". Then I click the "Back" button, but the screen remains the same and it starts loading data, or at least says it is, but nothing seems to be happening for a very long time. I was able to get the map and specimen data, however, by navigating to the family, genus and species. has anyone else experienced this problem?"

I think we need to change the search section to clear this up. At present it reads "Search by name" [with box] and "Search by county" [with boxes]. Change this so it says "Search for specific taxon by name" [with box], then blank line, then the word "OR" in caps and bold, then blank line, then "List all taxa by county". Some day we can add another option to search by concept where after entering the name you would select from the list of possible sources, but that is low priority.
