

Kepler - Bug #2840

Kepler beta3 will not run on Mac OSX10.3

05/14/2007 11:03 AM - Dan Higgins

Description			
Kepler 10.3 will not run under Mac OSX 10.3 (but does on Mac OSX 10.4). Kepler beta2 does work OK! It looks like the problem is due to the lack of Java 1.5 on OSX 10.3. The installer is set to use Java 1.4+. If we force it to use '1.4' (no plus) it no longer works under OSX 10.4. Looks like it was compiled under Java 1.5 and has a problem running under 1.5.

Need to check if Kepler works OK for new OSX 1.5 release!

#2 - 12/11/2007 10:08 AM - Dan Higgins

This is a problem with the Beta3 installer and what is now an out-of-date Mac OSX version (now 2 version beyond OSX 10.3). Thus not really a 1.0 bug. I am marking as WONTFIX for Beta3, but will try to fix in new installer.
