Description

Some fields aren't tab stops, so the only way to get to them is to use the mouse. This is unfortunate. It would be nice to shift-arrow to get to non-tab-stopped controls?? how would this work?? some would have to be tab-stop-enableable or otherwise flagged (in the tag, or look at whether it's visible and not-locked and enabled)?

Done in v224_p0328_mid1. This was relatively easy to do, and will only have very small benefits, but perhaps when there is a lot of subsampling on stems, it will be helpful. Ctrl left and right are already used to zoom between modules on cover. There are almost no non-tabstops on planted woody stems. But it may be helpful.
