Description The Unicode number does not mean anything to most users. Maybe we can put an if statement when the value of recordDelimiter and fieldDelimiter is a unicode number. The ones I have noticed are. #x0A <U000A> LINE FEED (LF) - This one is commonly used with recordDelimiter. #x09 <U0009> CHARACTER TABULATION (HT) horizontal tabulation - This once is commonly used with fieldDelimiter I think the comma delimiter is not a problem.
