Description

Generalize the reading of skin.configs to read any property within a skin config property file and pass them all as parameters in a transformation (using DBTransfrom.java). Currently it is hardcoded to read/pass only 3: registryurl, registryname, and lsidauthority.

History

#1 - 01/10/2008 03:14 PM - Chris Barteau

Modified DBTransform.doTransform()

#2 - 01/14/2008 08:29 AM - ben leinfelder

Another part of this should involve removing/migrating the special skin.configs directories/properties files and including them in the actual lib/style/skins/* directory of the individual skins that wish to utilize these extra properties. Currently there are too many different places for "skin-specific properties" to be set.

#3 - 01/14/2008 09:17 AM - Chris Barteau

Bens comment #2 regarding migrating files around to other locations may be true, but warrant further discussion as to what should be migrated where and is a separate issue at to what is addressed by this bug. This bug is specific to what parameters are passed to XSL transformations rather than file location.
