Kepler - Bug #3167

Customize documentation fails when ports added

02/29/2008 10:40 AM - Dan Higgins

Bugzilla-Id:	3167			

Description

New customized documentation dialog has a 'null' error when ports have been added.

To see the error, customize an RExpression actor by adding 2 new input ports. Then right click to Documentation/Customize and add some text describing the new ports. When the dialog is closed a null error occurs. If no new ports are added, customized documentation seems to work OK.

This seems to work for me. I might have fixed it and forgotten to close this bug. reopen this bug if it fails to work again.

The testing process I used was this:
1) drag rexpression onto canvas
2) add two ports
3) choose customize documentation
4) add documentation to the new ports
5) save the docs
6) display the documentation.

I get no errors and the documentation is successfully saved.
