Description

Just as we can flag cultivated records, we should have a way to flag widely published but incorrectly identified records. Consider Baptisia cinerea reported in USDA and the GA atlas from Wheeler Co, GA, which has subsequently been reidentified as B. lanceolata. This should probably get a special color (that gets covered over by even a site record) on the map indicating a record that is incorrect. The correction mechanism should be in the admin functions, just like tagging cultivated observations.
