Description			
My fix to bug #3324 has broken getUniqueFileName functionality, so e.g. if you have two actors with the same name (e.g. in different composites), and both serialize dataframes to disk, the one that runs second will overwrite the .sav file from the first. Downstream actors trying to use the serialized data from the first actor may not get it, depending on timing.			

History

#1 - 05/30/2008 01:34 PM - Derik Barseghian

Fixed.

- added overloaded getUniqueFileName method that also takes portname as an argument.
- using this method, myput can now take as 2nd arg a filename instead of a portname.
- cleaned up myput a little -- now only calls to the method contain java variables.
