Description

We need a better patching system, which is very basic at best. Currently you have to know about a patch (via the listserv) and download it from there. Would be a lot better if you asked it to check for updates, and it would download the list of available updates from CVS. Each update would have SQL that it would use to determine if the entry tool needed/could use the patch. If so, it would prompt you to download and apply it, but backup your database first.
