### Description

If during configuration an error is thrown and the user is returned to the main configuration screen, all the sections show as being unconfigured even if they were.

## History

**#1 - 10/22/2008 10:32 AM - Michael Daigle**

This happens during a database configuration error. Changed the code so that after an exception is caught, all the information is populated in the request object before calling the main configuration page.
