

InfoVeg - Bug #3589

Go through and map species by stratum: are floating and aquatic species assigned to those strata?

Description

The old style entry tool never mapped the stratum definitions from the herb datasheet onto the stratum definitions on the plot-cover sheet very well (see bug 2659). It had to be done manually. Further, people were unaccustomed to fidgeting with the herb data headers. There are cases I've seen where a floating or submerged stratum is defined, but not recognized as separate by the herb team. This can probably be done retroactively based on species.

Example:

051-08-0110 Eriocaulon is mixed in with all the other more terrestrial species in the herb stratum. But they defined an aquatic stratum, with no species put in it.
