Description

Morpho currently has configuration info about schemas, layout, and help hints spread across at least 4 types of configuration files (config.xml, package wizard config files, xml editor config files, and dtds). There may also be some hardcoded stuff in the code. Need to consolidate allof this information into one easy to use configuration scheme. This will probably involve using xml schema docs directly to extract information. We should however maintain a distinction between schema configuration (dtd/schema) and layout configuration. I'm not sure we currently maintain this difference well.
