#### Description

On my linux box, kepler r16420, ptll r52162 if I:

ant clean-all, ant run, kepler launches with no errors.

However, on a 2nd ant run, I get an error with DistributedComposite actor. On subsequent 'ant run's, no error. Getting this error the second time only is repeatable here (ie if I begin again with an ant clean-all).

With or without the launch error, dragging the DistributedComposite actor to canvas gives an error:

```
Error inside GetMomlFromLSID.getMoml(): Could not clone 'DistributedCompositeActor' from the 'org.kepler.distributed.DistributedCompositeActor' class; the object is null, possibly meaning it was not found. Perhaps there is a classpath problem and/or the karlib needs to be flushed?
```

```
[run] Error creating alternateGetMoml!  
[run] com.microstar.xml.XmlException: *** Canceled. in file:/home/barseghian/dev2/kepler.modules/ at line 1 and column 97  
[run] at ptolemy.moml.MoMLParser.startElement(MoMLParser.java:3385)
```

#### History

##### #1 - 01/22/2009 03:01 PM - jianwu jianwu

move distributed composite actor info to master-slave dir. From now on, if users want to use distributed composite actor, he/she has to change module to master-slave firstly.
