

EML - Bug #3836

runEMLParser script should include saxvalidate

Bugzilla-Id:	3836		

Description

a script is located in the /lib/ called runEMLParser which runs a java class to check references and IDs in instance documents. It does not check the document against the schema (SAXValidate). The online emlparser and the unit tests run both, and the parser script would be more useful if it also ran both. It should only validate against the schema in it's parent directory, so in eml 2.1, you would only be able to validate 2.1 instances.

History

#1 - 02/24/2009 01:27 PM - Jing Tao

A main method in SAXValidate class was added. This main method will invoke the method which will validate the eml instance against schema. I also add the command line in runEMLParser script to call the class. So now the runEMLPaser will check both reference ids and schema validation.
