check that all command line arguments are passed to the execution scripts.

#2 - 04/24/2009 04:46 PM - Chad Berkley

There are now two ways to do this. On the installed version of kepler, you can use the kepler.sh or kepler.bat files to pass whatever arguments you want. On the svn version of kepler, use the command 'ant startupScript' to generate the scripts in the root kepler directory. Those scripts can be passed arguments.

In addition, this will also create a kepler.jar file in the root that can execute kepler with 'java -jar kepler.jar'. Please see the startup scripts for specific syntax.
