Description

I got an email from Kirsten:

Could you point me to more information about the KNBRegistry thesaurus?
On my windows machine, when I try to select it, I get the following error:
"parsing config file threw: java.net.MalformedURLException. And then I get
a message "Could not load selected vocabulary".

This is windows installer (RC1). But this feature works on my linux development box.

History

In both GenericTreeVocabularyPage and GenericVocabularyPage, the method initVocab will read a file. The file name was:
File.separator + vocab + ".xml";

However, it use this way to read file "this.getClass().getResourceAsStream(vocabFilePath)". This means it will read file from a jar. In windows, the File.separator will be "\". But somehow the jar file path doesn't like "\". When I change to SLASH, it works.
