

EML - Bug #4114

Update stylesheets to improve entityCodeList display

05/27/2009 05:32 PM - Jim Regetz

Description

The measurement domain information displayed by Metacat skins and Morpho is cryptic for enumeratedDomains that use entityCodeList. It currently shows internal entity id numbers, which have no meaning to end users.

For reference, here is the relevant part of the EML spec:

<http://knb.ecoinformatics.org/software/eml/eml-2.1.0/eml-attribute.html#enumeratedDomain>

Example:

1. Browse to <http://knb.ecoinformatics.org/knb/metacat/judithk.306/knb>
2. Click on View Metadata for the data table "elephantbuffalo2001.txt"
3. In the Attribute(s) Info table, click on the Domain Info link for the "Specie code" attribute

The displayed numbers are internal entity ids for the "MEGAHERBIVORE CENSUS LUT.txt" data table, its 'Code' attribute, and its 'Species' attribute, respectively.

The simplest enhancement is probably to extract and display the relevant table name and code/definition attribute names, instead of the ids. A more extensive modification would be to extract and display the actual codes/definitions directly, but that might not be worth the additional effort.
