Description

The Morpho XML editor allows the copying and pasting of tree nodes (and their children). Currently, copying the root node does not work, however. This would be very useful, however, in cases like eml-attribute documents where there are many attribte nodes directly under the root and one wishes to copy all of them to a new document.

A simple replacement of the root node with a new root is easily implementsed. The problem is that this approach also copies identifier nodes. We thus need to put the old identifier back into the new identifier nodes.

This problem essentially disappears with the eml2 editor, since what were different modules are now subtrees in a single document. Any of these can be copied from one document to another.
