Description

We have isolated the metacat problem to problems with the individual server "space.lternet.edu". These problems surfaced after the computer was upgraded to Solaris 8 (from 7). The problem is not Solaris 8 related, however, because a metacat installation on another LTER computer is able to function. When the metacat installation was point to the ldap server on space.lternet.edu, the metacat did not work to authenticate. It did work to do unauthenticated searches.

I set up a Morpho to point to the metacat on lorax.lternet.edu with a user: dblankman,o=unaffiliated,dc=ecoinformatics, dc=org. In this configuration the full system worked.
